COLORED BRONZE PIGMENTS IN POWDER

Colored bronze pigments, are metallic products of copper powder or copper/zinc alloy, obtained by a milling process that generates "flake" form particles, chemically treated on its surface producing a color variety and metallic shades with excellent brightness.

Is important to consider that a tone variation will occur when the pigment gets in contact with the solvent and/or carrier, because of the oxidation's treatment own nature.

The Colored Line is also available in:

- **Powder**
- **Solvent based paste at 90% of solids (Meta Line).**
- **Water based paste at 85% of solids (Hydropaste Line).**

Our shade cards show the coloring, fineness and properties for the different applications.

Other shades and qualities may be prepared as special products.
